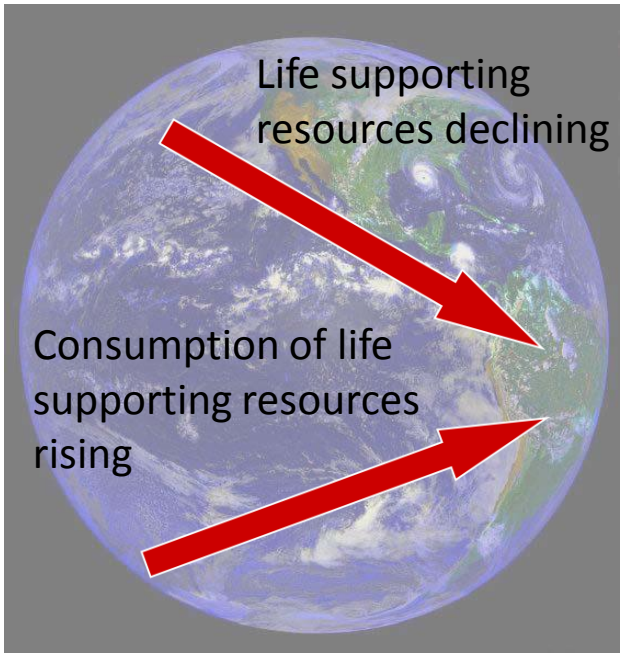
Outline

- Green Building in Context
- Overview of Building and Energy Codes
- Overview of Standards and Rating Systems
- USGBC LEED Rating Systems
- LEED for Homes
- UMass Sustainability Initiative

Global Climate Change

Human activity is destroying life sustaining resources



Earth Impacts

Climate disturbance

Species extinction

Mineral and resource depletion

Ozone depletion

Air pollution

Water pollution

Scarcity and unreliability of rain fall

Depletion of soil quality

Multifaceted Problem		Multifaceted, Systemic Change
Knowledge and Attention	=	Advocacy
Technology and Design	=	Expertise in green building, energy, transportation, etc.
Time and Money	=	Business Development, Finance and Accounting
Skills and Capacities	=	Education and Training
Politics and Power	=	Leadership and Organizational Culture
Organizational Limitations	=	Social Marketing Techniques
Failure to Understand Systemic Reality	=	Systems Thinking

Based on chart by Leith Sharp

The Solution Must Be System Based

Institutional Drivers	Institutional Systems		Global Environmental Systems	Global Environmental Systems

Institutional Drivers	Institutional Systems	Create Relationship between Earth + Institution	Earth Systems	Earth Impacts
Mission	Material supply and disposal	Make hidden upstream & downstream environmental impacts known	**Ecosystems**	Species extinction, increase in infectious vectors
Leadership	Food supply	Develop learning organization capacities	**Climate systems**	Climate disturbance
Organizational Culture	**Energy supply and distribution**	Mission alignment between teaching, research & operations	**Oceanic systems**	Ozone depletion, air pollution
Finance/ Accounting Structures	Building Design and Construction, Mechanical systems, Occupancy	Align Finance & accounting systems to support long term health	**Geological systems**	Rising sea levels, deep ocean current changes, fisheries depletion
Decision Making Processes	Water supply		**Water systems**	Desertification, land pollution
Human Resources	Transportation	REDUCE CONSUMPTION	**Nutrient systems**	Mineral and resource pollution
Building O & M	Non-vehicular circulation	SHIFT TO RENEWABLE energy and materials		Water pollution, scarcity of rain fall
Academic Planning	Landscaping	ENHANCE ECOSYSTEM HEALTH in campus design		Soil quality depletion
Campus Planning		CLOSED LOOP SYSTEMS		build up of toxins

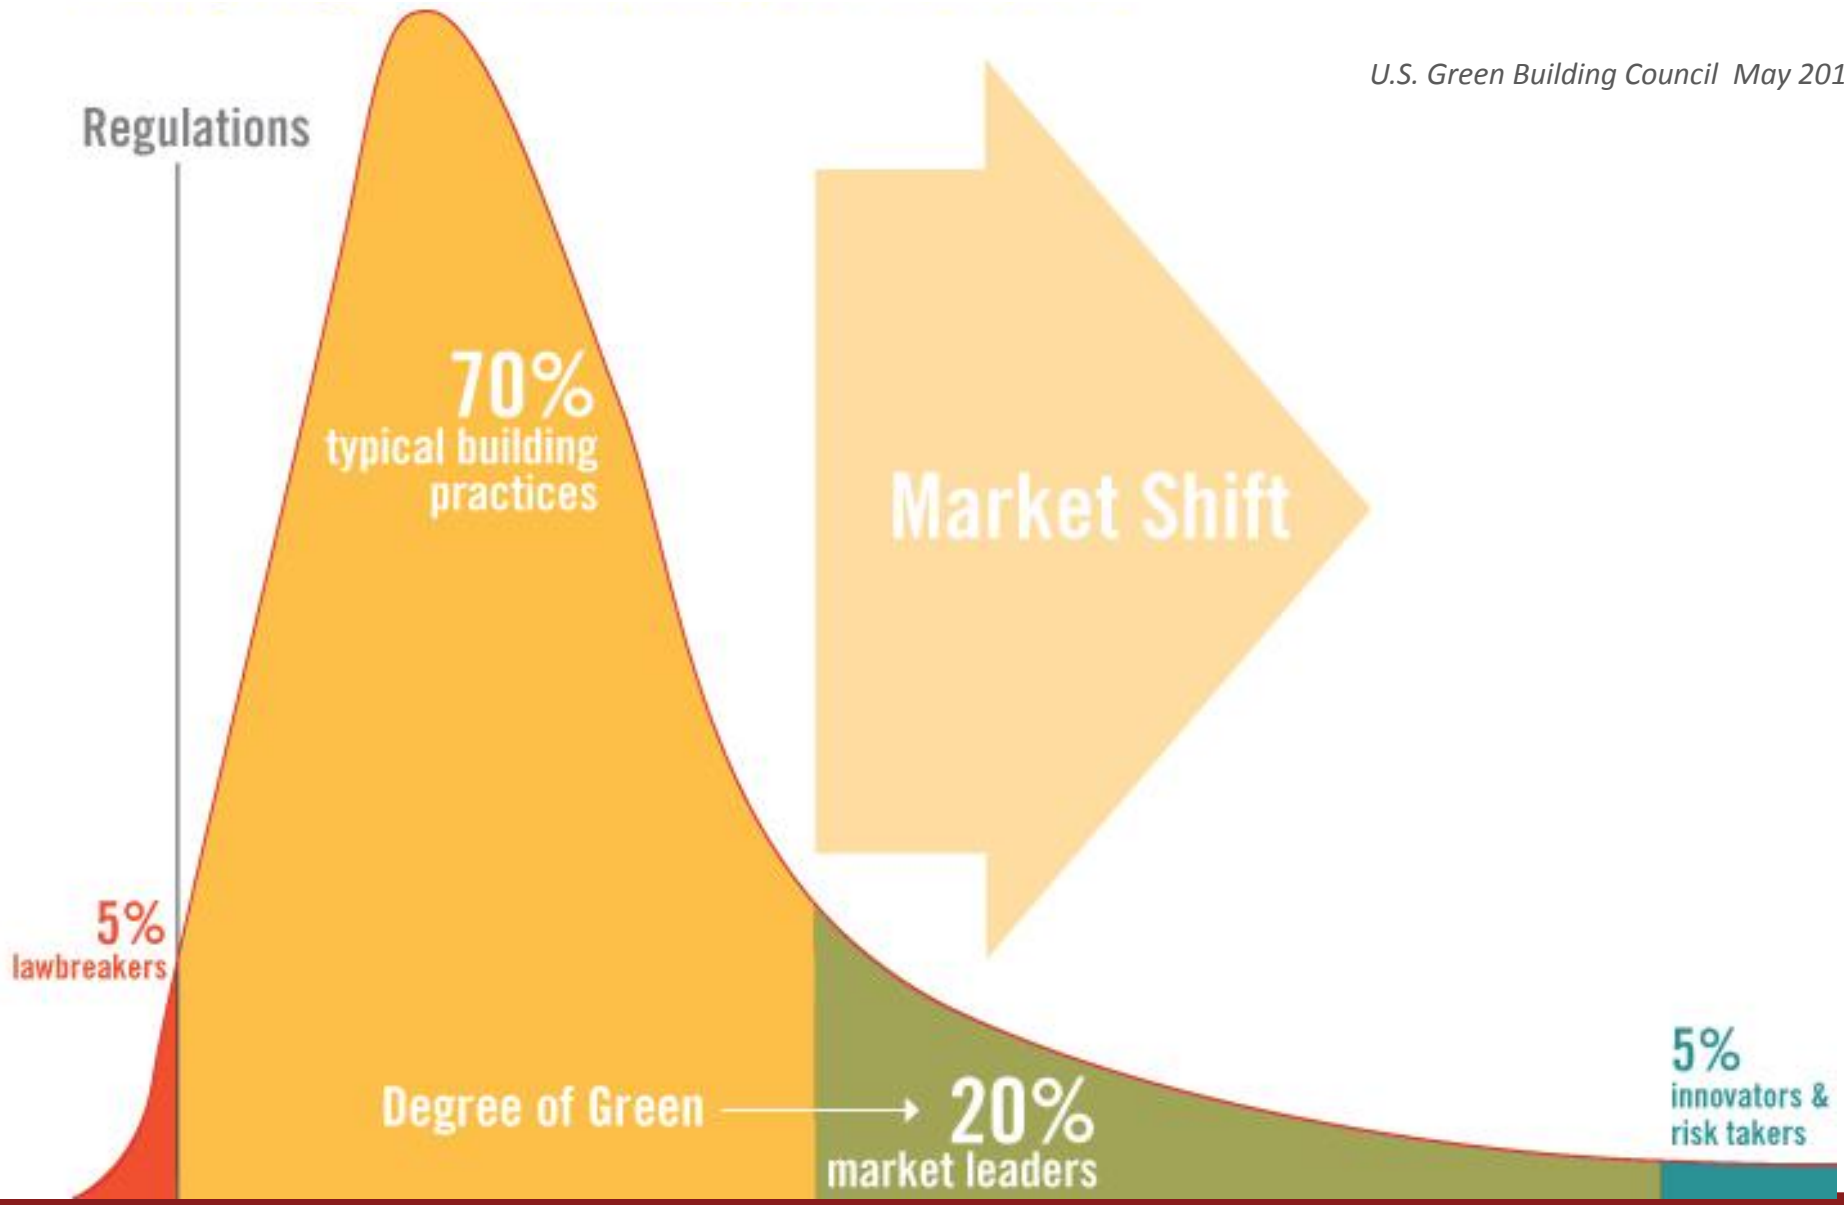
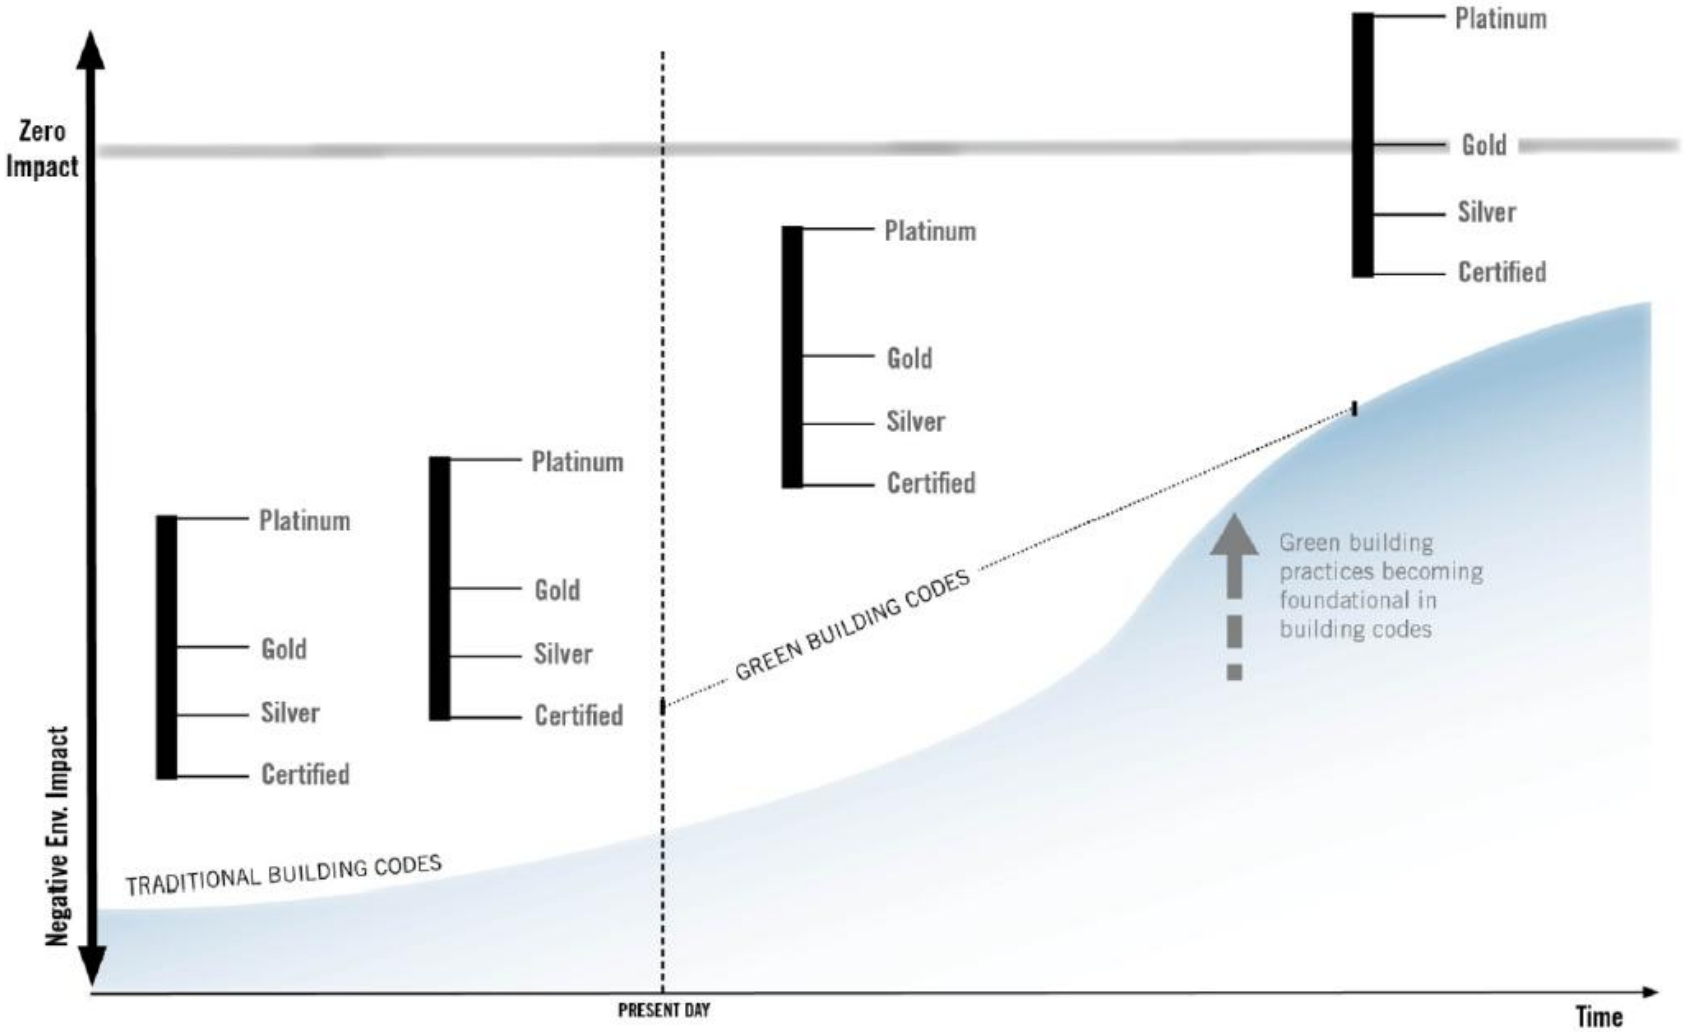
Green Building Progress Toward Sustainability

U.S. Green Building Council May 2011



Green Building Progress Toward Sustainability



U.S. Green Building Council May 2011

Traditional Building Codes

- Systematic statement of a body of rules that govern and constrain the minimum level of design, construction alteration & repair of buildings
- Based on requirements for safety, health, environment & quality of life of building users & community
- Model codes are developed by states, professional societies & trade associations
- State or municipal authorities adopt codes as law
- Examples: International Construction Code, Building Officials & Code Administrators Code (BOCA), National Building Code, Uniform Building Code, etc.

International Code Council

- 50 states & DC have adopted a number of I-codes

- International Building Code
- International Energy Conservation Code
- International Existing Building Code
- International Fire Code
- International Fuel Gas Code
- International Mechanical Code
- ICC Performance Code
- International Plumbing Code
- International Private Sewage Disposal Code
- International Property Maintenance Code
- International Residential Code
- International Wildland Urban Interface Code
- International Zoning Code

Green Building Codes

- International Code Council – International Green Construction Code (in final review, out in late 2011)
- 2010 California **Green Building** Standards (CALGreen) **Code** , mandatory provisions effective January 1, 2011.

Energy Codes

- ICC– International Energy Conservation Code 2009 – model code; makes allowances for different climate zones
- CA Title 24 1978 – Energy Efficiency Standards for residential and non-residential buildings; updated periodically (CALGreen)

Green Building Standards

- ANSI/ASHRAE 189.1-2009 Standard for the Design of High-Performance Green Buildings (ANSI Approved; USGBC and IES Co-sponsored)
- International Living Institute/ Cascadia Green Building Council: Living Building Challenge

ASTM INTERNATIONAL
Standards Worldwide

ASHRAE
Advancing HVAC&R to serve humanity and promote a sustainable world

LIVING BUILDING CHALLENGE™ 2.0

U.S. GREEN BUILDING COUNCIL USGBC

IES Illuminating ENGINEERING SOCIETY

Energy Standards

- ANSI/ASHRAE/IESNA Standard 90.1 – 2007 Energy Standard for Buildings Low-Rise Residential, and Informative Appendix G, Performance Rating Method (performance)
- ASHRAE Advanced Energy Design Guide for Small Office Buildings (2006), Retail Buildings (2006), Small Warehouses & Self Storage Buildings (2008), K-12 School Buildings (prescriptive)
- New Buildings Institute – Advanced Buildings™ Core Performance Guide (prescriptive)

Green Building Rating Systems

- USGBC Leadership in Energy & Environmental Design LEED™
- Green Point Rating System (for new & existing homes; CA Title 24, 2005 +15%)
- National Association of Home Builders: NAHB Green Guidelines
- Green Globes (Green Building Initiative in collaboration with NAHB)
- Collaborative for High Performance Schools (CHPS)

MISSION

Buildings and communities will regenerate and sustain the health and vitality of all life within a generation.

VISION

To transform the way buildings and communities are designed, built and operated, enabling an environmentally and socially responsible, healthy and prosperous environment that improves the quality of life.

USGBC LEED™ Rating Systems

- New Construction (NC)
- Existing Buildings: Operations & Maintenance (EB: O&M)
- Commercial Interiors (CI)
- Core & Shell (CS)
- Schools (SCH)
- Retail
- Healthcare (HC)
- Homes & Multi-family Midrise
- Neighborhood Development (ND)

EPAC Green Building Committee: Why Do it?

LEADING BY EXAMPLE

In April of 2007, Governor Deval Patrick signed **Executive Order 484** which mandates all new government buildings earn LEED certification and implement other sustainable design practices.

In November of 2007, President Jack Wilson signed the **Presidents' Climate Commitment** which includes the expectation that all new building projects achieve LEED Silver Certification or better.

The **UMA Campus Climate Action Plan** of 2010 aligns campus goals with those of the Commonwealth.

GOING BEYOND

LEED is one tool in the quest for a more sustainable built environment. The GBC is using LEED to help steer sustainable design and building on campus. However, the GBC is aware that LEED is a limited approach to sustainable building. For this reason, we continue to look beyond LEED, towards more integrative and holistic environmental design.

REGIONAL PRIORITY

INNOVATION IN DESIGN

PRIORITY LEVELS

HIGH = CREDIT STRATEGY SHOULD INFLUENCE DESIGN.

MEDIUM = CREDIT SHOULD BE PURSUED WHEN IT IS PRACTICAL FOR THE PROGRAM.

LOW = CREDIT IS ACHIEVED IF POSSIBLE.

FEASIBILITY LEVELS

EASY = CURRENT POLICY/EXISTING INFRASTRUCTURE MAKES CREDIT COMPLIANCE AUTOMATIC.

MODERATE = MINOR ADJUSTMENTS TO THE STATUS QUO.

DIFFICULT = REQUIRES A SPECIFIC APPROACH DURING DESIGN/CONSTRUCTION AND/OR SIGNIFICANT CHANGES TO THE CURRENT CAMPUS STRUCTURE.

Priority | Feasibility Checklist

High Priority Credit as defined by Green Building Guidelines

MR 7: CERTIFIED WOOD

HIGH PRIORITY | MODERATE FEASIBILITY
1 POINT + 1 (EXEMPLARY)

LEED CREDIT INTENT

To encourage environmentally responsible forest management.

LEED CREDIT REQUIREMENTS

Use a minimum of 50% of wood-based materials that are certified in accordance with the Forest Stewardship Council's principles and criteria.

- structural framing
- dimensional framing
- flooring
- sub-flooring
- wood doors
- finishes

Wood purchased for temporary use (construction) on the project may be included at the discretion of the team.

An additional point can be earned if 95% or more of the project's new wood is FSC-certified.

UMA CREDIT DISCUSSION

UMA is committed to sustainable forestry and building practices should reflect that commitment. The use of FSC certified wood throughout projects is a high priority. Research in the Building Construction Technology department is closely linked with local sustainable forestry efforts. This credit does not establish a minimum quantity of wood, and most UMA projects use very little wood. Therefore, the use of 50% FSC certified wood should be specified early in the design process.

EA 1: OPTIMIZE ENERGY PERFORMANCE

HIGH PRIORITY | MODERATE FEASIBILITY
1-18 POINTS (+ 1 EXEMPLARY)

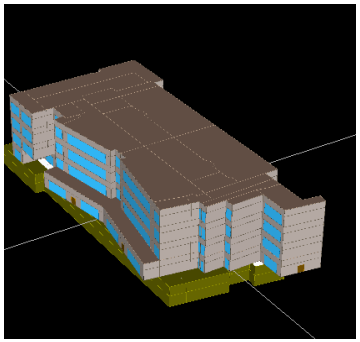
LEED CREDIT INTENT

To achieve increasing levels of energy performance beyond the prerequisite standard to reduce environmental and economic impacts associated with excessive energy use.

LEED CREDIT REQUIREMENTS

Demonstrate a reduction in energy costs using 1 of 3 compliance options:

1) Whole Building Energy Simulation: ASHRAE 90.1 (1-19 points)
2) Prescriptive: ASHRAE Advanced Energy Design (1 point)
   - Only for offices, retail or warehouses.
3) Prescriptive: Advanced Buildings Core Performance (1-3 points)
   - Only for buildings under 100,000 sf, health care and labs are ineligible.



NLSB ENERGY MODEL

UMA CREDIT DISCUSSION

The University favors the Whole Building Simulation (i.e. “energy modeling”) path for a number of reasons. First, energy modeling has the potential for optimizing building design in a way that a prescriptive path may not. Second, as an academic institution, the ability to compare predicted performance to actual performance is valued. Third, more LEED points are available to projects using this path.

Meeting the requirements of Executive Order 484 - a 20% reduction in energy costs - will earn projects 5 points under EAc1. Design teams are encouraged to go beyond the 20% reduction, although specific targets will vary by building type and function. More important than a numerical objective is the process by which project teams integrate the design and energy modeling to ensure that buildings are as energy efficient as possible within the project scope and budget. Designers and energy modelers should maintain a continuous cycle of designing and modeling that begins in the pre-design stage and has iterations through the final construction documents.

All campus projects must consider the future flexibility of building programming. The University recognizes that this requirement may at times impede attainment of the maximum energy cost reduction. However, it will help ensure that buildings have the longest lifecycle possible, one of the fundamental considerations in sustainable building and design.

EA 2: ON-SITE RENEWABLE ENERGY

LEED CREDIT INTENT

To encourage and recognize increasing levels of on-site renewable energy self-supply to reduce environmental and economic impacts associated with fossil fuel energy use.

LEED CREDIT REQUIREMENTS

Use on-site renewable energy systems to offset building energy costs.

Use the building annual energy cost calculated in EA Credit 1 or the U.S. Department of Energy's Commercial Buildings Energy Consumption Survey database to determine the estimated electricity use.

Eligible systems include: photovoltaic, wind, solar thermal, bio-fuel electric, geothermal heat/electric, low-impact hydroelectric, and wave and tidal.

UMA CREDIT DISCUSSION

All Commonwealth agencies are required to meet the target of 15% of annual electric usage procured from renewable sources by 2012[1], and the University is aligned with this goal.[2]

New projects are ideal candidates for renewables, the most viable options being photovoltaic and solar thermal. (There is not enough wind in the region to make wind power practical for the campus.) Design teams should consider integrating pilot projects featuring renewable technologies developed by faculty researchers. Building site and design should be assessed to ensure a best fit for the chosen technology. It is also expected that teams will incorporate strategies - such as day lighting - that reduce the overall energy load so that less energy generation is required. Consider alternatives to the standard applications of renewable technologies, for example, PV panels that also function as a shading system for windows or landscape. For roof-mounted installations, teams should coordinate closely with the roofing contractor to ensure guarantee of the roof warranty.

Creativity is encouraged when it comes to potential financial structures for the funding of renewable energy generation.
